

PRODUCT & TECHNICAL DOCUMENTATION

How InSyte CRM is built, and what it does.

One document. Part 1 is the stack, architecture, and integrations. Part 2 is the product: modules, features, and the paths people follow in the app.

September 2026 Version: current codebase Audience: product, sales, and engineering

CONTENTS

What is in this document

Read Part 1 if you need to know how the system is put together. Read Part 2 if you need to explain or use the product. Screenshots are from a local Acme workspace. That workspace had no leads or properties yet, so several screens show empty states. The layout is still the live product.

Names in this document match the product: **InSyte**, **InSyte CRM**, **InSyte AI OS**. Typeface is Inter. Colour tokens come from the app: dark #275564, accent #38b6ff, green #00bf63.

BEFORE YOU START

00 How to read this

This is not a pitch deck. Sentences describe what the software actually does. Where the marketing site talks about scoring, voice campaigns, or social posts, and the code does not ship those yet, they are listed as **not built yet**.

There are three apps in one repository:

- **Marketing site** — public landing, demo and trial forms, legal pages.
- **Platform** — `/platform` for InSyte superadmins. Plans, channel partners, usage.
- **Tenant CRM** — `/{{company}}/...` or a custom CRM domain. This is what a channel partner's team uses every day. Public property pages live on the same tenant, or on a separate website domain.

PART 1

How it is built

Stack, architecture, tenancy, integrations, and the plan system that turns modules on and off.

ARCHITECTURE

1.1 What the system is

InSyte CRM is a multi-tenant Laravel application for real-estate channel partners. Each company is a tenant with its own database. The central database holds plans, tenants, and platform users.

Tenancy is implemented with Stancl Tenancy. Identification is by path (`/acme/dashboard`) or by a verified custom domain. Tenant databases, cache, files, and queues are isolated. A tenant can also attach two domain purposes: **CRM** (the app) and **website** (public property pages).

1.2 Stack

Layer	Technology	Notes
Runtime	PHP 8.3	Typed, constructor promotion, enums
Framework	Laravel 13	Routing, Eloquent, queues, mail, validation
Tenancy	Stancl Tenancy 3.10	Database-per-tenant plus cache, files, queues
Database	MySQL in this environment	SQLite and Postgres managers are configured
Auth (platform)	Laravel Breeze	Login, reset, email verification
Auth (tenant)	Separate session controller	Company login at <code>/tenant/login</code>
HTML	Blade	CRM, platform, microsite CMS
Behaviour	Alpine.js 3	Drawers, tables, pipeline chart, inbox
Islands	React 19 + Vite 8	Landing, charts, date pickers, UI primitives
CSS	Tailwind CSS 4	Inter via Bunny Fonts
Charts	Recharts	Reports and analytics
Dates	Ataskit datetime picker	Follow-ups, visits, tasks
Tests	Pest 4 + Pint	Feature tests are the default
Queue / cache / session	Database drivers	Local default

1.3 What each technology is used for

This is the map from product capability to library or service.

Capability	What it uses
Company isolation	Stancl Tenancy: one database per tenant, plus cache, filesystem, and queue bootstrappers
CRM screens	Blade layouts, Alpine stores, Tailwind. Lead drawer loads HTML over fetch
Marketing site	React landing mounted on #landing-root; Framer Motion, GSAP, Lenis for motion
Report charts	React + Recharts islands on Blade report pages
InSyte AI OS	OpenAI Responses API via <code>OpenAiChatClient</code> ; tools in <code>InsyteAiTool</code>
Google Sheets leads	<code>google/apiclient</code> , <code>connect/verify/map/sync</code> ; <code>scheduled google-sheets:sync</code> every minute
Facebook Lead Ads	Meta OAuth callback, page token, field mapping, <code>/api/webhooks/meta/leads</code>
99acres, Housing, MagicBricks, NoBroker	Per-tenant webhook URL <code>/api/webhooks/{portal}/wh_...</code>
Website / custom forms	<code>POST /api/v1/leads</code> with a Bearer token on the tenant
WhatsApp today	Opens WhatsApp Web compose (<code>web.whatsapp.com/send</code>). Not the WhatsApp Business API
Public project pages	Property microsite Blade + <code>microsite.css</code> ; enquiry creates a lead
Custom domains	DNS CNAME check, purpose CRM or website
Module access	<code>PlanFeature</code> + <code>PlanCapability</code> + <code>PlanLimitKey</code>
User access	Custom roles and <code>TenantPermission</code> (not Spatie)
Automations	Lead activity event → match workflows → actions (task, note, status, follow-up)

1.4 How the code is organized

HTTP controllers stay thin. Work lives in Actions. List screens and KPIs live in Query objects. Validation lives in Form Requests. Statuses and plan keys are PHP enums.

Folder	Role
<code>app/Actions</code>	One job: create a lead, run an automation, complete OAuth, sync a sheet, run an AI turn
<code>app/Queries</code>	Listings, dashboard KPIs, reports, team performance
<code>app/Http/Requests</code>	Input rules at the HTTP boundary
<code>app/Enums</code>	Lead status, plan features, permissions, automation triggers

Folder	Role
app/Support	AI client, Google Sheets client, Meta Graph client, plan access
app/Events	e.g. lead activity recorded → dispatch automations

Platform users and tenant users are both `User` models, but they log in through different routes and middleware. Superadmin is a platform gate. Tenant permissions are checked with `permission: middleware` and Blade `<x-tenant.can>`.

1.5 Surfaces and tenancy

Platform login at `/platform/login`. Superadmins only.

Tenant login at `/{{company}}/login`. This example is the Acme workspace.

Custom domains: a tenant admin pastes a hostname, creates a CNAME to the InSyte target, then verifies. Purpose **crm** serves the CRM. Purpose **website** serves public project pages. Suspended tenants cannot use either surface.

1.6 Integrations and APIs

Lead ingest is the same idea everywhere: a payload arrives, it is normalized, a lead is created in the tenant database, activity is logged, automations may run.

Source	Entry	Auth
Lead API	POST <code>/api/v1/leads</code>	Bearer tenant token
Meta Lead Ads	GET/POST <code>/api/webhooks/meta/leads</code>	Verify token (GET); signature on POST
Facebook OAuth	GET <code>/api/oauth/facebook/callback</code>	OAuth state / session
Portals	POST <code>/api/webhooks/{portal}/wh_...</code>	Per-endpoint webhook secret
Google Sheets	Scheduler + on-demand sync	API key / sheet sharing as configured
Microsite form	POST <code>.../projects/{slug}/enquire</code>	Throttle 8/minute

Settings → Integrations. WhatsApp Business and Email are marked coming soon on this screen.

Google Sheets connection list: add a sheet, verify, map columns, sync or pause.

Facebook pages: connect, verify, map lead form fields, activate or pause.

Portal webhook setup (99acres shown). Housing, MagicBricks, and NoBroker use the same pattern.

The Lead API settings screen shows a live token. That screenshot is not in this PDF. The endpoint is POST /api/v1/leads with header Authorization: Bearer {token}. Fields: name (required), phone, email, source, budget, location, property_type, configuration.

1.7 Plans as controls

Superadmins define plans. A plan has modules (features), optional packs (Basic / Advanced / Custom) on CRM, Reports, Automations, and InSyte AI, plus numeric limits.

Create Plan wizard: Basic info → Pricing → Features → Limits → Review.

Default plan	What it turns on	Example limits
Starter	CRM, properties, bookings, revenue, reports, teams, automations, inbox, WhatsApp, API + Sheets. No AI, no microsites.	5 users, 2,000 leads, 0 AI messages / month
Growth	Everything in Starter plus InSyte AI (basic pack), microsites, custom domains, Facebook	15 users, 10,000 leads, 1,000 AI messages / month
Pro	All modules, advanced AI pack, all integration capabilities	50 users, 50,000 leads, 10,000 AI messages / month

Limits that exist in code: users, leads, automations, automation runs / month, WhatsApp messages / month, AI messages / month, integrations, properties, teams, microsites.

Plans index. This local platform database had no saved plans yet — empty state of the live screen.

Channel partner records (tenants) sit next to plans. Superadmins create a company, assign a plan, and inspect users, subscription, usage, integrations, and activity.

Channel partners list.

One partner overview (Acme).

1.8 Shipped vs not built

Item	Status
CRM leads, activities, tasks, documents, import/export, duplicates	Shipped
Properties, bookings, invoices, payouts, reports, analytics	Shipped
InSyte AI OS Chat and tools (search, schedule, complete, notes, tasks)	Shipped Plan-gated
AI tabs: Lead Insights, Content & Scripts, Task Assistant, Reports & Analysis	Not built yet
Automations: lead created, status changed, follow-up scheduled	Shipped

Item	Status
Automation trigger: follow-up overdue	Not ready
Automation send WhatsApp / email actions	In enum, not selectable
WhatsApp compose from a lead (opens WhatsApp Web)	Shipped
WhatsApp Business API, Email, Calendar integrations	Not built yet
Lead scoring, voice campaigns, social post generation	Marketing only
Platform: Revenue, Quotations, Integrations, Analytics, Utilities, Settings	Stub pages

PART 2

What it does

Product overview, modules, the full feature list, why each piece exists, and the paths users follow.

PRODUCT

2.1 Product overview

InSyte CRM is for people who sell property through a channel-partner business. The daily job is: take an enquiry, follow up, take a site visit, book a unit, and see commission.

Public marketing site. The product promise on this page is broader than what Chat currently does; Part 1.8 is the accurate list.

Who uses it

Role	Where	Typical work
Sales executive	Tenant CRM	Leads, WhatsApp, follow-ups, site visits, tasks
Team lead / manager	Tenant CRM	Assign leads, pipeline, team performance, reports
Tenant admin	Settings	Users, roles, domains, integrations, company profile
Platform superadmin	/platform	Plans, onboard partners, usage
Buyer (public)	Property page	View a project and send an enquiry

Lead pipeline

Converted and Lost are closed states. They are not chosen from the normal status dropdown; they are set by Close or Mark lost actions.

Operating loop

Step	In the product
Capture	Manual lead, import, API, Sheets, Facebook, portals, microsite enquiry
Follow up	Call / WhatsApp, scheduled follow-up, site visit, tasks, notes
Book	Convert lead → booking (property, unit, agreement value)
Earn	Invoice, mark agreement, payout received, revenue screens

2.2 Product modules

The tenant sidebar is the module map. Items appear only if the user's role allows it and the company's plan includes that feature.

Dashboard

Welcome line, five KPIs (total leads, active leads, site visits, bookings, sales), sales pipeline by status, today's tasks, and My Day (follow-ups and site visits due).

The screenshot displays the InSyte CRM Tenant Dashboard for a user named Acme Admin. The interface features a sidebar on the left with navigation links: Dashboard, InSyte AI OS, Leads, Activities, Tasks, Properties, Bookings, Revenue, Reports, Teams, Automations, and Settings. The main content area is titled 'Welcome, Acme Admin' and includes a top navigation bar with a user profile dropdown. The dashboard is composed of several widgets: five KPI cards at the top showing 'Total Leads' (0), 'Active Leads' (0), 'Site Visits' (0), 'Bookings' (0), and 'Sales' (₹0); a 'Sales Pipeline' widget showing a list of lead statuses (New, Contacted, Qualified, Follow-up, Site Visit, Negotiation, Converted, Lost) with a count of 1; a 'Today's Tasks' widget showing 0 tasks; and a 'My Day' widget showing 0 activities. The dashboard is currently empty, indicating no leads or tasks are present in this workspace.

Tenant dashboard. Empty KPIs because this Acme workspace has no leads yet.

InSyte AI OS

Chat is shipped. The model can search leads, read today's agenda, schedule or complete follow-ups and site visits, create or complete tasks, and add notes. Other tabs are visible and labelled as not ready. Access: permission `ai.use` and plan feature InSyte AI.

InSyte AI OS — Chat tab with example prompts and quick actions. BETA in the UI.

Leads

All leads table with search, filters, import, column editor, bulk assign / status / delete. Sub-views: Priority, Unassigned, Converted, Lost, Duplicates. Opening a lead uses a drawer (name, status, budget, property type, notes, documents, timeline, WhatsApp, follow-up, site visit, tasks).

Leads list. Columns include name, phone, source, requirement, assignee, status, next follow-up, last activity.

Add Lead: name, phone, email, source, budget, location, property type, configuration, assignee.

Activities

Home for scheduled work. Follow-ups and site visits are separate lists with reschedule and complete. Site visits record type (fresh visit or revisit) and a property.

Activities home.

Follow-ups list.

Site visits list.

Tasks

Standalone task list plus tasks on a lead. Statuses: Pending → In progress → Complete, or Cancelled.

Search by task, lead, or assignee...

Create TaskEdit Columns

All Tasks

TASK	RELATED TO	ASSIGNED TO	DUE DATE	STATUS	ACTIONS
No tasks found.					

Tasks.

Properties

Project inventory (apartment, villa, plot, shop, office). Status, website visibility, optional public microsite. Microsite CMS sections: hero, highlights, about, configurations, amenities, visuals, location, developer, call to action.

Properties. Counts for total, active, inactive, featured.

Bookings

Create a booking from a converted (or converting) lead: property, unit, agreement value, date. Later: mark agreement, create invoice.

Bookings.

Revenue

Sales totals, invoices (edit, PDF, mark paid), payouts (mark paid). This is how commission is tracked in the product today.

Revenue.

Invoices.

Reports

Operational reports with export and print. Analytics adds velocity, aging, property-type performance, source and agent tables. Plan-gated: analytics, export, print.

Reports.

Analytics.

Teams

Sales teams, members, archive. Performance view per team. Team Inbox is a header drawer (conversations, attachments), gated by the Team Inbox plan feature.

Teams.

Team performance.

Automations

Workflows: trigger + conditions + actions, test run, on/off. Templates: WhatsApp / email / SMS copy with merge variables. Workflows apply to leads assigned to the current user unless the workflow is set otherwise in the editor.

Automations home.

Workflows — create, search, on/off filter.

Message templates.

Settings

Tabs: Profile, Company, Security, Users, Roles & Permissions, Domains, Integrations. Roles are switch-based permissions grouped by module.

Roles & permissions.

Custom CRM and website domains.

Workspace users.

Platform

Superadmin: dashboard, channel partners, plans. Revenue & Billing, Quotations, Integrations, Analytics, Utilities, and Settings in the platform sidebar are stub routes today.

Platform dashboard.

2.3 Master feature list

Capture

Feature	Status
Add lead (modal)	Shipped
Import / export CSV	Plan-gated
Duplicate detection and merge	Plan-gated
Lead API	Plan-gated
Google Sheets sync	Plan-gated
Facebook Lead Ads	Plan-gated
99acres, Housing.com, MagicBricks, NoBroker webhooks	Plan-gated
Microsite enquiry → lead	Plan-gated

Work the lead

Feature	Status
Status, budget, property type, assignment	Shipped
Notes, documents, activity timeline	Shipped
Schedule / reschedule / complete follow-up	Shipped
Schedule / complete site visit (fresh or revisit)	Shipped
Tasks on lead and global task list	Shipped
Bulk assign, bulk status, bulk delete	Shipped
Table column preferences	Shipped
WhatsApp compose (WhatsApp Web)	Plan-gated
Close / mark lost with reasons	Shipped
Priority / unassigned / converted / lost views	Shipped

Convert and earn

Feature	Status
Booking (property, unit, agreement value)	Plan-gated
Mark agreement	Plan-gated
Invoice create, edit, PDF, mark paid	Plan-gated
Payouts mark paid	Plan-gated
Revenue dashboard	Plan-gated

Team and admin

Feature	Status
Sales teams and members	Plan-gated
Team performance	Plan-gated
Team Inbox	Plan-gated
Users, roles, permission switches	Shipped
Custom CRM and website domains	Plan-gated

Automate and AI

Feature	Status
Workflows: create task, add note, change status, schedule follow-up	Plan-gated
Conditions on status, source, budget, property type, location	Shipped
Message templates	Plan-gated
AI Chat tools listed in 2.2	Plan-gated
AI Lead Insights / Content / Task Assistant / Reports tabs	Not built yet

2.4 What each feature is for

Plain reasons, tied to the screens above.

Feature	What it is for
One lead list	Stop splitting enquiries across Excel, WhatsApp, and portal dashboards
Source field + integrations	See whether a lead came from an ad, a portal, a sheet, or a form
Priority and unassigned views	Managers see what needs a person today
Duplicates	Two records for the same phone become one, with a merge in the timeline
Follow-up and site visit schedules	The next action has a time, not a chat reminder that gets buried
Pipeline on the dashboard	Count leads in each stage without exporting
Bookings → invoices → payouts	Agreement value and commission sit next to the lead that produced them
Reports / analytics	Conversion, aging, and source performance from the same database
Roles	An agent can work leads without editing company settings or integrations
Plans and packs	InSyte sells Starter / Growth / Pro without forking the codebase
Automations	The same first response happens when a lead is created or a status changes
InSyte AI OS Chat	Ask in language: find a person, schedule a visit, write a note — without hunting menus
Microsites	Share a project URL; the enquiry lands as a lead
WhatsApp compose	Start a chat with the lead's number and log that a message was sent. It does not send inside InSyte

2.5 User journeys

1. Superadmin creates a channel partner

1. Sign in at `/platform/login`.
2. Open Channel Partners → create company (wizard: company details, admin user, plan).
3. Partner appears on the list. Overview, users, subscription, and usage are available.
4. The new admin signs in at `/{$slug}/login` and lands on the dashboard.

Partners list.

Partner subscription.

2. Agent starts the day

1. Sign in to the tenant CRM.
2. Dashboard: My Day and today's tasks.
3. Open Priority leads, or ask InSyte AI OS "what is due today?".
4. On a lead: call or WhatsApp, log activity, complete or reschedule the follow-up.

After login — dashboard.

3. Facebook or portal lead arrives

1. Admin connects Facebook or copies a portal webhook in Settings → Integrations.
2. A buyer submits a lead form on Meta or a portal.
3. Webhook creates the lead with the right source.
4. If a workflow is on for “lead created”, InSyte can add a task, a note, change status, or schedule a follow-up.
5. The assigned agent sees the lead in the list and contacts them.

4. Google Sheet row becomes a lead

1. Settings → Integrations → Google Sheets → add spreadsheet URL.
2. Verify access, map columns (name, phone, and the other mappable fields).
3. Connect. Sync now, or wait for the one-minute scheduler.
4. New rows appear as leads. Pause stops further sync without deleting the connection.

The screenshot shows the InSyte CRM interface with a sidebar on the left containing navigation links: Dashboard, InSyte AI OS, Leads, Activities, Tasks, Properties, Bookings, Revenue, Reports, Teams, Automations, and Settings. The main content area is titled 'Google Sheets' and includes a 'Back to Integrations' link and an 'Add New Sheet' button. Below the title, there is a message: 'Connect a Google Sheet to capture leads into this workspace. The sheet must be shared as "Anyone with the link can view".' A summary section displays four metrics: TOTAL SHEETS (0), TOTAL SYNCED (0), TOTAL SKIPPED (0), and TOTAL FAILED (0). Below these metrics are buttons for 'Sync All Active Sheets' and 'Refresh'. A section titled 'All Sheets' shows '0 sheet(s)' and a message: 'No Google Sheets connected yet.'

Google Sheets connections.

5. Site visit to booking to payout

1. On the lead, schedule a site visit (property + fresh visit or revisit + time).
2. Complete the visit (outcome / notes as the form requires).
3. Move through negotiation. Close as converted and create a booking (or create booking from Bookings).
4. Mark agreement if needed. Create invoice. Download PDF.
5. When commission is received, mark the payout paid. Revenue totals update.

Bookings.

Payouts.

6. Property page enquiry

1. Add a property. Turn microsite on (plan must include microsites).
2. Edit CMS sections and media.
3. Share `/tenant/projects/slug` or the website domain URL.
4. Buyer submits Enquire. A lead is created, throttled to 8 per minute per project.

This local Acme workspace had no properties, so there is no public microsite screenshot in this edition.

7. Ask InSyte AI OS to schedule a follow-up

1. Open InSyte AI OS. Stay on Chat.
2. Example: "Schedule a follow-up for Rahul tomorrow at 4pm."
3. The model calls `search_leads / get_lead`, then `schedule_follow_up`.
4. The follow-up appears on the lead and in Follow-ups / My Day. Usage counts against the monthly AI message limit.

Chat is the path that can write to the CRM. Other tabs are not built yet.

8. Admin sets a role

1. Settings → Roles & Permissions → create or edit a role.
2. Switch permissions by group (Leads, Activities, Revenue, and so on).
3. Settings → Users → assign the role. An agent without `settings.company` will not see company or domain tabs.

Role editor with permission groups.

9. Marketing visitor books a demo

1. Open the public site.
2. Submit Book demo or Start trial.
3. The submission is stored centrally (`LandingSubmission`). It is not a tenant lead until someone onboards that company.

Landing — product modules.

Landing — lead sources.

Generated from the InSyte CRM codebase and screenshots of <http://localhost:8000> on 8 September 2026. Tokens and secrets are omitted. Rebuild: `node capture.mjs` then `node print-pdf.mjs` in `docs/insyte-documentation`.
